Pregnant and traveling? Learn about Zika virus, and consider delaying travel to affected areas until health experts say it’s safe.

Learn about Zika virus.

- Zika spreads to people through mosquito bites—but not a bite from any mosquito. The type of mosquito that spreads the virus only lives in certain parts of the world.
- Zika is affecting parts of Central and South America, Mexico and the Caribbean. The type of mosquito that spreads the virus is common there. Find the latest locations at the link below.
- Most people infected with Zika don’t get sick. However, Zika may cause birth defects, so pregnant women should take steps to avoid the virus.
- There is no vaccine.

If you’re pregnant, consider delaying travel to an affected area until health experts say it’s safe.

- If it’s not possible to delay travel, talk to a doctor first. The mosquito that spreads Zika is very aggressive. The mosquito bites during the day and early evening. Use insect repellants approved by the EPA. Insect repellant is safe for pregnant women. Wear long sleeves and pants. Wear clothing treated with permethrin (a chemical that repels insects). Use a mosquito bed net if you cannot keep mosquitoes out of your residence.
- If you are pregnant and did travel to an area affected by Zika, contact your health care provider immediately.
- If you are trying to become pregnant, talk to your doctor before traveling.
